Kanen Loading Equipment reports that Seaport Canaveral, Florida has just installed 7 of their 12 inch model MLA260 marine loading arms. What is special about the installation is the fact that the MLA’s in question are required to reach 85 feet from the centerline of the MLA to the mating ships manifold prior to initiating the transfer process. While there are no records kept regarding the reach of marine loading arms, Kanon believes these arms, standing 101 FT high, could be the longest reaching arms in service to date and they can now offer terminal owners greater flexibility in how they design and build their terminals.
